

Automate Patching Cycles to Mitigate Risk

Stefania Costa Cirillo
IT Manager

Vicarius's TOPIA enabled Etekplus to automate their patching process and reduce risk across their range of IT products.

The Challenge

As a leader in the field of iGaming, Etekplus focused on providing advanced and secure software for their users. However, as their business grew so did the number of systems, vulnerabilities, and patches. Their reliance on manual patching proved to be no match for the amount of vulnerabilities they were facing. For Etekplus, growing in parallel with their customer's business was their main priority. A corresponding growth in their risk management, IT, and security teams was not an option. They needed a scalable solution that could automate the patching process and reduce the risk to their customers—that's where Vicarius came in.

Vicarius's automated patching capabilities reduced our exposure faster and better than any other solution.

The Solution

TOPIA's risk-analysis engine helped Etekplus identify various high-risk applications that were vulnerable to exploitation.

Within 2 weeks, Etekplus reduced their risk level simply by patching and protecting with TOPIA's vulnerability management tools.

TOPIA has changed how Etekplus approaches risk reduction by empowering them to automate the patching process.
