

# Merge Security & IT to Remediate Threats

Oshri Cohen  
CISO

**Vicarius's TOPIA enabled Adama to centralize and consolidate work between IT and security teams, leading to a more efficient patching workflow.**

## The Challenge

With a large amount of assets and employees scattered across the globe, Adama was having a difficult time centralizing their patching strategy. Their security team would detect the vulnerabilities, but when it came time for patching, this work would be relegated to the IT team. This gridlock caused inefficiencies that impacted their ability to patch quickly and prioritize the ones with the highest level of risk to their networks. For Adama, their business always came first and protecting it was their main priority. But they needed a solution that could merge these teams and consolidate the work—that's where Vicarius came in.

*"Vicarius's solution was able to merge our security and IT teams together for seamless vulnerability remediation."*

Oshri Cohen  
CISO

## The Solution

TOPIA's risk-analysis engine helped Adama identify many high-risk applications that were vulnerable to exploitation. Within 2 weeks, Adama reduced their risk level significantly, simply by patching and protecting with TOPIA's vulnerability management tools. TOPIA has empowered Adama to centralize their patching mitigation strategy by merging security and IT teams.
